In such an ink-jet printing apparatus, there is a case where the printing medium is transported so as to cross a boundary between two heads, which are adjacent to each other in the conveying direction, and the heads discharge ink onto the printing medium in a state where the two heads overlap with each other. In this case, in the state of the ink discharged onto the printing medium, the ink is accumulated at a position located inside the boundary, where the heads overlap with each other, due to surface tension of the ink. In particular, in the case where the printing medium is composed of a fabric or a non-woven fabric,
